Description:

In QlikView 11 a new patch build methodology has been introduced (MSP). Rather than having to do a full install of server or desktop to get a patch we now employ a system to upgrade files in-place. A patch build can be removed and the system is back to the original Service Release (SR) version that was in place before the custom patch build was applied.

Note: You can only have one MSP installed so a new one will remove the older one.

Installing Patch builds:

1. Obtain patch package link from support.

2. Extract contents of patch package to a folder of your choosing.

3. When the patch package is extracted you will find a Patch builds.doc and a QikView Server Patch X64 (or X86).msp.

4. The MSP is used to patch the standard MSI install. Note - The MSP requires the initial MSI package to install. This is usually in place after a standard install.

5. Double-click the MSP file to install.

6. You will be presented with a window asking if you wish to stop services and restart after the install is complete or you can proceed without stopping but a reboot is required after the install is complete in this case.

7. Once the install is finished, QlikView will be up and running on the patch build.

Uninstall Patch build:

1. Go to Programs and Features in the Control Panel of the Operating System.

2. In the upper left you will see Tasks. Select View installed updates.

3. Scroll to the QlikView Update.

4. Uninstall the update.

5. Once uninstall is complete you will be back to the original version of QlikView prior to the custom patch being applied.
